Heavy Duty Safety Switches

Series F

Product Description

The Square D™ by Schneider Electric brand Heavy Duty Safety Switch is designed to be tough, reliable and provide exceptional performance in the most grueling conditions; from commercial and institutional to industrial and manufacturing facilities. F Series safety switches provide significantly higher levels of mechanical endurance than NEMA Type KS-1 or UL98 standards require. The design life of a F-Series switch is a minimum of three times the NEMA requirement.

An abundance of copper is used in the heaviest current carrying power paths of all Square D by Schneider Electric Heavy Duty Safety Switches. The more copper for current carrying paths, the lower the temperature rise. Managing temperatures inside the switch is the key to providing greater service life.

All heavy duty safety switches feature a quick-make, quick-break operating mechanism, a dual cover interlock and a color-coded indicator handle.

Applications

Heavy duty safety switches are designed for the following applications:

- Commercial and industrial installations
- Up to 600 Vac or 600 Vdc maximum
- Up to 200,000 rms symmetrical amperes short circuit current
- 30–1200 A
- Horsepower ratings
- Load-make, load-break rated for the switch current rating
- Seismically Qualified to the:
 - 2010 ASCE 7
 - 2012 International Building Code (IBC)
 - 2013 California Building Code (CBC)
 - State of California's Office of Statewide Health Planning and Development (OSHPD) requirements for seismic certification

H362AWA Interlocked Receptacle Switch with Appleton Powertite Receptacle

Receptacle Switches

Interlocked receptacle switches are furnished with a factory-installed, three-phase, four-wire, Appleton Powertite™, Crouse-Hinds Style 2 Arktite™ or Hubbellock™ receptacle. The fourth wire is connected to the switch equipment grounding terminal and is not a solid neutral termination. Interlocking linkage between the receptacle and switch mechanism prevents insertion or removal of the plug while the switch is in the “ON” position or insertion of any plug other than specified. The interlocking mechanism also prevents the switch from being turned “ON” if a plug has not been fully inserted into the receptacle.

Sample Applications

1. To prevent two devices from being closed simultaneously:

Figure 1: Sample Application

Figure 1 shows two devices that are not to be closed at the same time.

- Using key interlocks shown, only one key is required to operate the system
- Both devices are shown open, therefore, the key is free
- To close any one device insert the key and turn that particular lock
- The key is held in this lock until the device is locked open
- The procedure described above is the same for two devices, neither of which is to be opened simultaneously

2. To prevent the opening of switch A when circuit breaker B is closed:

Figure 2: Sample Application

Figure 2 shows switch A and circuit breaker B in the closed position.

- Key A-1 is held in circuit breaker B interlock
- Open the circuit breaker
- Turn key A-1 in the L-O-R interlock on circuit breaker B to lock open; Key A-1 is now free
- Insert key A-1 in the L-C-R interlock on switch A and turn to unlock
- Open switch A. Key A-1 is now held; Reverse the sequence to restore service

3. To prevent operation of switch A when circuit breaker B is closed. Permits re-closing of the circuit breaker for servicing when switch is locked open:

Figure 3: Sample Application

Switch A and circuit breaker B are in the closed position.

- Key A-1 is held in the circuit breaker interlock
- Open the circuit breaker
- Turn key A-1 in the L-O-R interlock on circuit breaker B to lock open; Key A-1 is now free
- Insert key A-1 in the L-O-C-R interlock on switch A and turn to unlock
- Open switch A; Key A-1 is now held
- Turn key A-1 in the L-O-C-R interlock on switch A to lock open; Key A-1 is now free
- Return key A-1 to circuit breaker interlock and unlock for operating during servicing period
- Reverse the sequence to restore service

4. To prevent paralleling of lines A and B; two loads, fed from either source (Main-Tie-Main):

Figure 4: Sample Application

Figure 4

Circuit breaker A is closed to supply load M. Circuit breaker B is closed to supply load N. Tie-circuit breaker C is open. Keys A-1 and held in interlocks on both circuit breakers A and B. Tie-circuit breaker C cannot be closed unless either A or B is locked open.

To transfer load N to circuit breaker A, proceed as follows:

- Open circuit breaker B
- Turn key A-1 in L-O-R interlock on circuit breaker B to lock open; Key A-1 is now free
- Insert key A-1 in L-O-R interlock on tie-circuit breaker B and turn to unlock; Key A-1 is now held
- Close tie-circuit breaker C
- Reverse the sequence to restore service
- Load M can be supplied through circuit breaker B in a similar manner

Evaluation of non-fusible switches in conjunction with molded case circuit breakers has not been performed above 100 A.

² The DTU361 and DTU361RB are also suitable for use on a circuit capable of delivering not more than (A) 18 kA, 600 Vac maximum when protected by Type FH circuit breaker rated 30 A maximum or (B) 14 kA, 600 Vac maximum when protected by Type FA circuit breaker rated 30 A maximum.

³ Any brand of circuit breaker or fuse not exceeding the ampere rating of the switch may be used ahead of a non-fusible safety switch when there is up to 10 kA short circuit current available.
